Connect 116
Release Notes

Report created: 12/03/2020 11:00:00

Notes / Special Instructions: This release and previous releases may include new feature work for FHIR. Although work was complete, the ability to send FHIR is not yet available.

This release contains the following items:

JIRA ID	ServiceNow Ref	Type	Title	Description
D10-2972	N/A	Defect	114 Hotifx - AWS MySql - Slow query in Connect Console	A slow query was found in the 112 Connect console and was impacting performance. A hotfix was provided which now forces indexing on the slow query.
D10-2920	N/A	Task	Fix SonarQube Code Smells	Whilst reviewing DMC in SonarQube a few code smells were found within the Connect code. The team have resolved these issues and reduced the number of code smells within the product.
D10-2905	N/A	Defect	Mesh Processor - Expired and Errored documents not sending status updates to hubs	Two issues were identified: 1. When rejecting MESH documents that have had no updates for 5 days, these are set to rejected status. Connect did not check if these document statuses needed passing back to the hubs. 2. If an error report is found from MESH, the documents are rejected again. These document statuses were not passed back again. Both issues have now been resolved and the correct status is now passed back to the sending hubs.
D10-2852	N/A	Task	INVESTIGATE - Receiving FHIR through the API	This task has been used to investigate the upcoming work involved with the "Receiving TOC documents" project.
D10-2730	N/A	Story	DMC - Early Warning	A new feature has been added for the Support teams to allow them to identify senders that have not posted in 24hrs.

				This will act as an alert for senders that could be experiencing issues.
D10-2707	DFCT0011361	Defect	Date filtering	When filtering Connect Documents, the system recognised December last year to be chronologically later than January of this year. This has now been resolved and date filter now works as expected.
D10-2705	DFCT0011374	Defect	Document Metadata notes not being moved	When updating and resending, some Metadata was not being moved from the old document to the new document, this included: - Notes - Gender
D10-2510	N/A	Defect	SUPPORT: TIF Conversion failure	An error was identified by support which was causing some documents to error during conversion to TIF. The issue was replicated and has now been resolved.
D10-2509	N/A	Defect	SUPPORT: Unknown Reason	An issue with NHS mail documents meant that documents would error with an 'Unknown Error'. Due to this error message not providing any detail, we have now added error ids which will help support establish the root cause of the unknown error.
D10-2506	N/A	Defect	SUPPORT: 400 No required SSL certificate	This task stops EMIS checked documents from being set to error if http status code is not 200, this is so that the documents can attempt again.
D10-2505	N/A	Defect	SUPPORT: Stop API from updating the status on archived documents	The ability to update the document status of archived documents was causing confusing in document audits. This is not possible now and once a document has been archived, status updates are not available.
