

Connect 95 Release Notes

Report created at: 24/05/2019 10:00:00 AM

Notes / Special Instructions: N/A

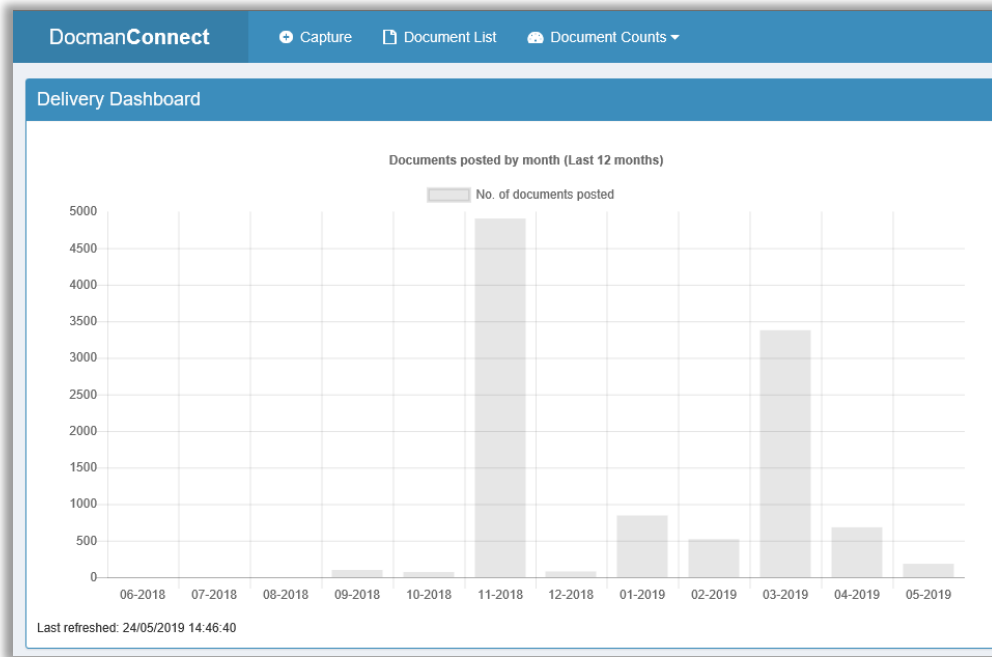

This release contains the following items:

JIRA ID	ServiceNow Ref	Type	Title	Description
D10-813	INTERNALLY LOGGED	Bug	Reject button not enabled	A bug was found whereby the rejection button was not enabled for collection users when either viewing delivered documents until the REJ01 rejection reason was reselected or a new reason selected. The console has now been changed so that users have to select a rejection reason before a document can be rejected.
D10-921	INTERNALLY LOGGED	Bug	Destination Type set on capture	Prior to a document being posted (captured via Capture console) to an organisation, the destination type is set to 3 in the database even though a destination had not been selected yet. A change has now been put in place to make the destination type NULL in the database until the document has been sent to a destination.
D10-968	INTERNALLY LOGGED	Bug	Organisation filters spacing issues	When using the Organisation filters with a long Database Host name via the Organisation management page, the Database Host name filter would indent to the left. This has now been resolved and the filter no longer indents.
D10-1171	INTERNALLY LOGGED	Bug	Organisation Details: Last connection showing for DM10 rather than DM7	The Last Connection (used to show the last time Scheduler collected for a DM7 site) was showing for DM10 Organisation types rather than DM7. This has now been amended so that the Last Connection shows against the DM7 organisation.
D10-1209	LOGGED BY CUSTOMER	Bug	Non-N3 Printer Driver	The previous printer driver created for Non-N3 customers would not work over TLS.1.2. A new driver has been created which works over TLS.1.2 and is now available upon request.
D10-1212	INTERNALLY LOGGED	Change	Remove ability for Console users to resend rejected documents	After a review of Connect documents, we found that a high number of documents were

				continuously being resent back to a practice even though a legitimate rejection reason had been used. This meant that documents were not being actioned in a timely fashion or being sent to the correct practice. Although the resend functionality has been removed, the ability to amend and resend is still present.
D10-1213	INTERNALLY LOGGED	Change	DM7 Rejections as system errors	To bring the Connect service in line with the EDT Hub product, Docman 7 system rejections will now show as system errors instead of user rejections.
D10-1228	CUSTOMER REQUEST	New Feature	Documents posted graph	Customers moving from the EDT Hub product previously had a documents posted graph available that showed how many documents had been posted over a 12 month period. This has now been added to Connect and will be available on Connect 95. Screenshot: 1 – Documents Posted Graph
D10-1230	CUSTOMER REQUEST	Change	Extra validation on User group creation	An issue was found when exporting users whereby the user groups were formatted incorrectly. After investigation we found that the formatting issue was caused by commas in the User group name. Extra validation has now been added to restrict the use of commas in User group names to prevent any formatting issues on export.
D10-1240	CUSTOMER REQUEST	Change	Adding example and requirements to bulk upload template	A request was made for Docman to add examples and any requirements needed for a bulk user upload. Examples have now been added to the template and any requirements specified. Screenshot: 2 – Examples
D10-151	INTERNALLY LOGGED	Change	Customer Counts not including archived	Document counts now include archived documents.
D10-1277	INTERNALLY LOGGED	Bug	Error page presented when accessing the error log	Due to a formatting issue of a particular error, users found that the errors log were not accessible. The formatting of this error has now been changed and will no longer present users with an error page when attempting to view errors.

Screenshots/Test Evidence:
